**Characters:** Keshav – Showroom Manager  
Shivansh – Showroom Advisor  
Charan – Customer (Car owner)

As Charan got a notification to his mobile application saying your car needs service as it completed 10000kms run, then got worried about these showrooms guys may accessing my location, my activities through this car mobile application. Next day he visits showroom with full of anger,

**Charan:** Excuse me! Who is there here? I need answers.

**Shivansh:** (Smiling professionally) Welcome back Sir! I'm Shivansh. I can help you. Is there an issue with your vehicle?

**Charan:** You tell me, Shivansh! Your app just told me my car needs service. How do you know that? Are you spying on my driving habits? and are you listening my phone calls that I'm attending in car. we have a serious privacy issue.

**Shivansh:** (Chuckles slightly, but remains polite) No sir. It's not like that let me educate you

**Charan:** Hey you're telling me that I'm uneducated?

**Shivansh:** No sir, listen to me

**Charan:** Then how did your app know about my car's health? Magic?

**Keshav:** Hey Shivansh!.. what happened

**Shivansh:** Keshav, this customer is worried we are uploading their personal driving data to our servers to predict their car services. Can you explain how our new system works?

**Keshav:** Oh, absolutely. Don't worry, your data never leaves your car. We use a completely new technology called Federated Learning.

**Charan:** Federated what? Federated

**Keshav:** Your car has a "brain"—a machine learning model—right inside it. It learns from how you drive, how the battery reacts to the weather, and how you charge it. The car trains itself locally.

**Shivansh:** Then, instead of sending us your personal driving data, your car just sends us a small mathematical update—the "updates" it learned.

**Keshav:** We gather these anonymous "updates" from thousands of cars, combine them to make our global model smarter, and send that smarter model back to your car. Your car used that smart model to analyze its own battery today, and the car decided to alert you. Not our servers.

**Keshav:** Have a look at our dashboard just like how you've your application, We've ours too

**\*Demonstration of App\* While Keshav and Shivansh Explaining Charan in tablet – whole class can see the same in projector**

**Charan:** (Relaxing, looking impressed) So, then federated learning playing crucial role in predicting my cars service while maintaining privacy of my data

**Keshav:** You nailed it. (All three turn to face the class)
